## The Model of Overhead-Free Computation

The Standard Model of Linear Space

Our Model of Absolutely No Space Overhead

## The Power of Overhead-Free Computation

Palindromes

Linear Languages

Context-Free Languages with a Forbidden Subword

Languages Complete for Polynomial Space

## Limitations of Overhead-Free Computation

Linear Space is Strictly More Powerful

# The Standard Model of Linear Space

tape

0	0	1	0	0	1	0	0
---	---	---	---	---	---	---	---

Turing machine

## Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **is larger than** input alphabet

## The Standard Model of Linear Space

tape

\$	0	1	0	0	1	0	0
----	---	---	---	---	---	---	---

Turing machine

### Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **is larger than** input alphabet

## The Standard Model of Linear Space

tape

\$	0	1	0	0	1	0	0
----	---	---	---	---	---	---	---

Turing machine

### Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **is larger than** input alphabet

## The Standard Model of Linear Space

tape

\$	0	1	0	0	1	0	\$
----	---	---	---	---	---	---	----

Turing machine

### Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **is larger than** input alphabet

## The Standard Model of Linear Space

tape

Turing machine

### Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **is larger than** input alphabet

## Linear Space is a Powerful Model

## Our Model of “Absolutely No Space Overhead”

tape

0	0	1	0	0	1	0	0
---	---	---	---	---	---	---	---

Turing machine

### Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **equals** input alphabet

## Our Model of “Absolutely No Space Overhead”

tape

1	0	1	0	0	1	0	0
---	---	---	---	---	---	---	---

Turing machine

### Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **equals** input alphabet

## Our Model of “Absolutely No Space Overhead”

tape

1	0	1	0	0	1	0	0
---	---	---	---	---	---	---	---

Turing machine

### Characteristics

- ▶ Input fills **fixed-size** tape
- ▶ Input may be **modified**
- ▶ Tape alphabet **equals** input alphabet

## Our Model of “Absolutely No Space Overhead”

Turing machine

### Intuition

- Tape is used like a RAM module

# Definition of Overhead-Free Computations

## Definition

A Turing machine is **overhead-free** if

- ▶ it has only a single tape,
- ▶ writes only on input cells,
- ▶ writes only symbols drawn from the input alphabet.

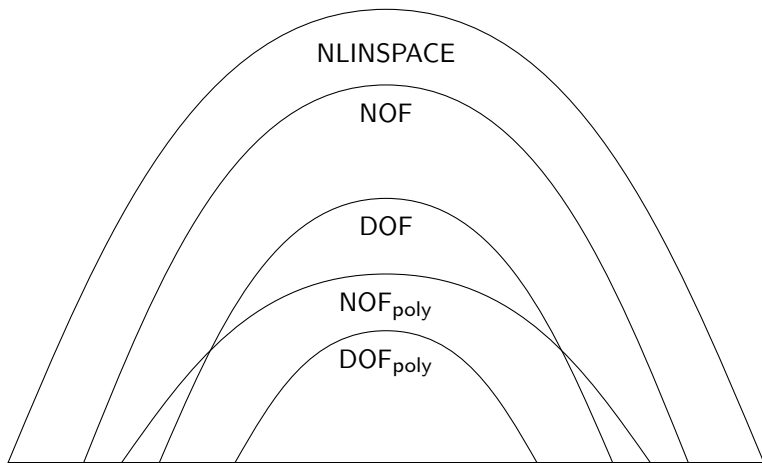

# Overhead-Free Computation Complexity Classes

## Definition

A language  $L \subseteq \Sigma^*$  is in

- ▶ **DOF** if  $L$  is accepted by a deterministic overhead-free machine with input alphabet  $\Sigma$ ,
- ▶ **DOF<sub>poly</sub>** if  $L$  is accepted by a deterministic overhead-free machine with input alphabet  $\Sigma$  in polynomial time,
- ▶ **NOF** is the nondeterministic version of DOF,
- ▶ **NOF<sub>poly</sub>** is the nondeterministic version of DOF<sub>poly</sub>.

## Simple Relationships among Overhead-Free Computation Classes

# Palindromes Can be Accepted in an Overhead-Free Way

## Algorithm

### Phase 1:

Compare first and last bit

Place left end marker

Place right end marker

### Phase 2:

Compare bits next to end markers

Find left end marker

Advance left end marker

Find right end marker

Advance right end marker

tape

0	0	1	0	0	1	0	0
---	---	---	---	---	---	---	---

overhead-free machine

# Palindromes Can be Accepted in an Overhead-Free Way

## Algorithm

tape

1	0	1	0	0	1	0	1
---	---	---	---	---	---	---	---

overhead-free machine

Phase 1:

Compare first and last bit

Place left end marker

Place right end marker

Phase 2:

Compare bits next to end markers

Find left end marker

Advance left end marker

Find right end marker

Advance right end marker

# Palindromes Can be Accepted in an Overhead-Free Way

## Algorithm

tape

0	1	1	0	0	1	0	1
---	---	---	---	---	---	---	---

overhead-free machine

Phase 1:

Compare first and last bit

Place left end marker

Place right end marker

Phase 2:

Compare bits next to end markers

Find left end marker

Advance left end marker

Find right end marker

Advance right end marker

# Palindromes Can be Accepted in an Overhead-Free Way

## Algorithm

tape

0	1	1	0	0	1	1	0
---	---	---	---	---	---	---	---

overhead-free machine

Find left end marker

Advance left end marker

Find right end marker

Advance right end marker

# Relationships among Overhead-Free Computation Classes

## A Review of Linear Grammars

### Definition

A grammar is **linear** if it is context-free and there is only one nonterminal per right-hand side.

### Example

$$G_1: S \rightarrow 00S0 \mid 1.$$

$$G_2: S \rightarrow 0S10 \mid 0.$$

### Definition

A grammar is **deterministic** if  
“there is always only one rule that can be applied.”

### Example

$G_1$  is deterministic.

$G_2$  is not deterministic.

# Deterministic Linear Languages Can Be Accepted in an Overhead-Free Way

## Theorem

Every deterministic linear language is in  $\text{DOF}_{\text{poly}}$ .

## Continued Review of Linear Grammars

### Definition

A language is **metilinear** if it is the concatenation of linear languages.

### Example

$\text{TRIPLE-PALINDROME} = \{uvw \mid u, v, \text{ and } w \text{ are palindromes}\}.$

# Metalinear Languages Can Be Accepted in an Overhead-Free Way

## Theorem

Every metalinear language is in  $\text{NOF}_{\text{poly}}$ .

# Relationships among Overhead-Free Computation Classes

# Definition of Almost-Overhead-Free Computations

## Definition

A Turing machine is **almost-overhead-free** if

- ▶ it has only a single tape,
- ▶ writes only on input cells,
- ▶ writes only symbols drawn from the input alphabet **plus one special symbol**.

# Context-Free Languages with a Forbidden Subword Can Be Accepted in an Overhead-Free Way

## Theorem

Let  $L$  be a context-free language with a forbidden word.

Then  $L \in \text{NOF}_{\text{poly}}$ .

The proof is based on the fact that every context-free language can be accepted by a nondeterministic almost-overhead-free machine in polynomial time.

# Relationships among Overhead-Free Computation Classes

## Some PSPACE-complete Languages Can Be Accepted in an Overhead-Free Way

### Theorem

DOF contains languages that are complete for PSPACE.

The proof is based on the fact that for every  $L \in \text{DLINSPACE}$  there exists an isometric homomorphism  $h$  such that  $h(L) \in \text{DOF}$ .

# Relationships among Overhead-Free Computation Classes

## Some Context-Sensitive Languages Cannot be Accepted in an Overhead-Free Way

### Theorem

$\text{DOF} \subsetneq \text{DLINSPACE}$ .

### Theorem

$\text{NOF} \subsetneq \text{NLINSPACE}$ .

The proofs are based on old diagonalisations due to Feldman, Owings, and Seiferas.

# Relationships among Overhead-Free Computation Classes

## Candidates for Languages that Cannot be Accepted in an Overhead-Free Way

### Conjecture

DOUBLE-PALINDROMES  $\notin$  DOF.

### Conjecture

$\{ww \mid w \in \{0, 1\}^*\} \notin$  NOF.

Proving the first conjecture would show  $\text{DOF} \subsetneq \text{NOF}$ .

## Summary

- ▶ Overhead-free computation is a more faithful **model of fixed-size memory**.
- ▶ Overhead-free computation is **less powerful** than linear space.
- ▶ **Many** context-free languages can be accepted by overhead-free machines.
- ▶ We conjecture that **all** context-free languages are in  $\text{NOF}_{\text{poly}}$ .
- ▶ Our results can be seen as new results on the power of **linear bounded automata with fixed alphabet** size.
